

I have read about the proposed BPL proposal and feel that the public good would be served much better by protecting the airwaves from the interference that this technology can cause until a viable method of protecting the airwaves can be found. The amateur radio service has and continues to provide an emergency communications asset that could be lost and that is not in the public good. Internet access and digital communications have valid routes by satellite, cable and telephone. This proposal is not needed and not in the best interest of the public good.

Respectively Yours  
David Anthony
